

INSTRUCTIONS FOR MONITORING

PERS Department for Environment Protection made Guidelines for environment monitoring in the right-of-way on the state road networks in the Republic of Serbia.

Objective of the Guidelines is to indicate the methodological approach which will establish continuous control and monitoring of environment quality indicators in road impact zone in all phases of its life cycle (planning, design, construction, use). With the collection of the information and their transfer to the user, insight is gained into the condition of certain environmental parameters, as a necessary precondition for fulfilling legal and international reporting obligations, in accordance with the laws regulating this field.

Obtained data form the basis for making annual reports and monitoring results will be used for defining recommendations and measures which should be implemented for improving the environment condition.

Based on these Guidelines, the Department for Environment Protection will initiate the production of monitoring plans which precisely define the locations and sampling dynamics, monitoring parameters, costs and institutional responsibility of the participants in this process. This way, conditions for systematic monitoring of the environment on the entire state road network will be created. This activity will enable registering of the locations exposed to excessive harmful effects of the road and traffic as well as timely planning of protection measures.
